Abstract

I added an imaginary term by hand to the proper time, ΔT , of special theory of relativity and wanted to see what will happen to it if I tried to get the time dilation relationship between $\Delta T'$ and ΔT . I found that this added imaginary term of time does not have to be zero.

If ΔT is the real, proper time of travel of a light beam from one point to the other,

$$\Delta t = \Delta T + i\Delta\xi \quad (1)$$

Δt will be the time I choose and work with in order to see what will happen to the imaginary part $\Delta\xi$ once I apply Einstein's special relativity. $i\Delta\xi$ here is an imaginary term which I added by hand. Consider two observers O and O' [1]. O fires a beam of light at a mirror a distance L away and measures the time interval $2\Delta T$ for the beam to be reflected from the mirror and to return to O . Observer O' is moving at a constant velocity u . As seen from the point of view of O , the beam is sent and received from the same point, while O' moves off in a perpendicular direction. The beam is sent from some point A and received at some point B a time $2\Delta T'$ later, according to O' . The distance AB is just $2u\Delta T'$. According to O , the light beam travels a distance $2L$ in a time $2\Delta T$. According to O' , the light beam travels a distance of $2\sqrt{L^2 + (u\Delta T')^2}$ in a time $2\Delta T'$. According to Galilean relativity, $\Delta T = \Delta T'$, and O measures a speed c while O' measures a speed $\sqrt{c^2 + u^2}$. According to Einstein's second postulate, this is not possible—both O and O' must measure the speed c . Therefore ΔT and $\Delta T'$ must be different. I can find a relationship between ΔT and $\Delta T'$ by setting the two speeds equal to c . According

¹sbenzahra@wittenberg.edu or benzahra@physics.umn.edu

to O , $c = 2L/2\Delta T$, so $L = c\Delta T$. According to O' , $c = 2\sqrt{L^2 + (u\Delta T')^2}/2\Delta T'$, so $c\Delta T' = \sqrt{L^2 + (u\Delta T')^2}$. Combining these, I find

$$c\Delta T' = \sqrt{(c\Delta T)^2 + (u\Delta T')^2} \quad (2)$$

and, solving for $\Delta T'$,

$$\Delta T' = \frac{\Delta T}{\sqrt{1 - u^2/c^2}}. \quad (3)$$

This relationship summarizes the effect known as time dilation. But in my calculation, where $\Delta t = \Delta T + i\Delta\xi$, I have according to O ,

$$c = \frac{L}{\Delta T + i\Delta\xi}. \quad (4)$$

I can see here in the equation just above that since I added an imaginary part to time, length in particular or space in general picked up an imaginary part also. According to O'

$$c = \frac{\sqrt{L^2 + [u(\Delta T' + i\Delta\xi')]^2}}{\Delta T' + i\Delta\xi'}. \quad (5)$$

Taking the expression of L from equation (4) and inserting it in equation (5) and squaring, I get

$$c^2(\Delta T' + i\Delta\xi')^2 = c^2(\Delta T + i\Delta\xi)^2 + u^2(\Delta T' + i\Delta\xi')^2. \quad (6)$$

Separating the real terms from the imaginary terms of equation (6) I get

$$[\Delta T'^2(1 - u^2/c^2) - \Delta T^2] - [\Delta\xi'^2(1 - u^2/c^2) - \Delta\xi^2] + 2i[\Delta T'\Delta\xi'(1 - u^2/c^2) - \Delta T\Delta\xi] = 0$$

I can see that time dilation relationship is given by setting the first part of the equation above equal to zero

$$\Delta T' = \frac{\Delta T}{\sqrt{1 - u^2/c^2}}. \quad (7)$$

I can also see that there is an effect of time dilation in the imaginary part, $\Delta\xi$, given by

$$\Delta\xi' = \frac{\Delta\xi}{\sqrt{1 - u^2/c^2}}. \quad (8)$$

Since a complex number vanishes only if its real and imaginary parts vanish too, I get

$$\Delta T'\Delta\xi'(1 - u^2/c^2) - \Delta T\Delta\xi = 0. \quad (9)$$

Taking the right-hand side of equation (8) and inserting it in equation (9), I get

$$[\Delta T'\sqrt{1 - u^2/c^2} - \Delta T]\Delta\xi = 0. \quad (10)$$

Equation (10) is the product of two terms. Since Einstein's relativity is considered to be true, the first part vanishes, and leaves us with the condition that $\Delta\xi$ can be different from zero. And if $\Delta\xi$ is different from zero that makes Δt imaginary since Δt is equal to $\Delta T + i\Delta\xi$ as indicated in equation (1). I have mathematically found that relativity allows time to have an imaginary part.
